

Walk. Ride. Drive. Smarter.

YOUR CONNECTED VEHICLE EQUIPMENT

Honda/Acura Vehicles

All drivers participating in the THEA Connected Vehicle Pilot will receive equipment enabling their cars to “talk” to other vehicles, traffic signals and more. This wireless communication can help you drive safely and keep traffic moving.

The equipment includes a head-up display, two antennas, and a dedicated short-range communications device that will be placed in your vehicle. The equipment is free and yours to keep upon completion of the pilot.

HEAD-UP DISPLAY

You will receive a head-up display that displays safety messages in certain hazardous situations. A speaker built into the head-up display will issue audio alerts.

SHORT-RANGE RADIO

The short-range radio is a small, rectangular device that will be installed in the trunk of your vehicle.

ANTENNAS

There are two antennas that will be installed in your vehicle. The first one will be installed on the roof of your car. The second antenna will be attached on the rear door quarter window side or rear windshield. The roof antenna will be attached magnetically and the interior one uses a safe, removable adhesive. The antennas will not damage or leave marks on your car.

The THEA Connected Vehicle Pilot is a research project sponsored by the U.S. Department of Transportation to test the potential safety, mobility and environmental benefits of connected vehicle technology.
